SAPIENZA
UNIVERSITÀ DI ROMA

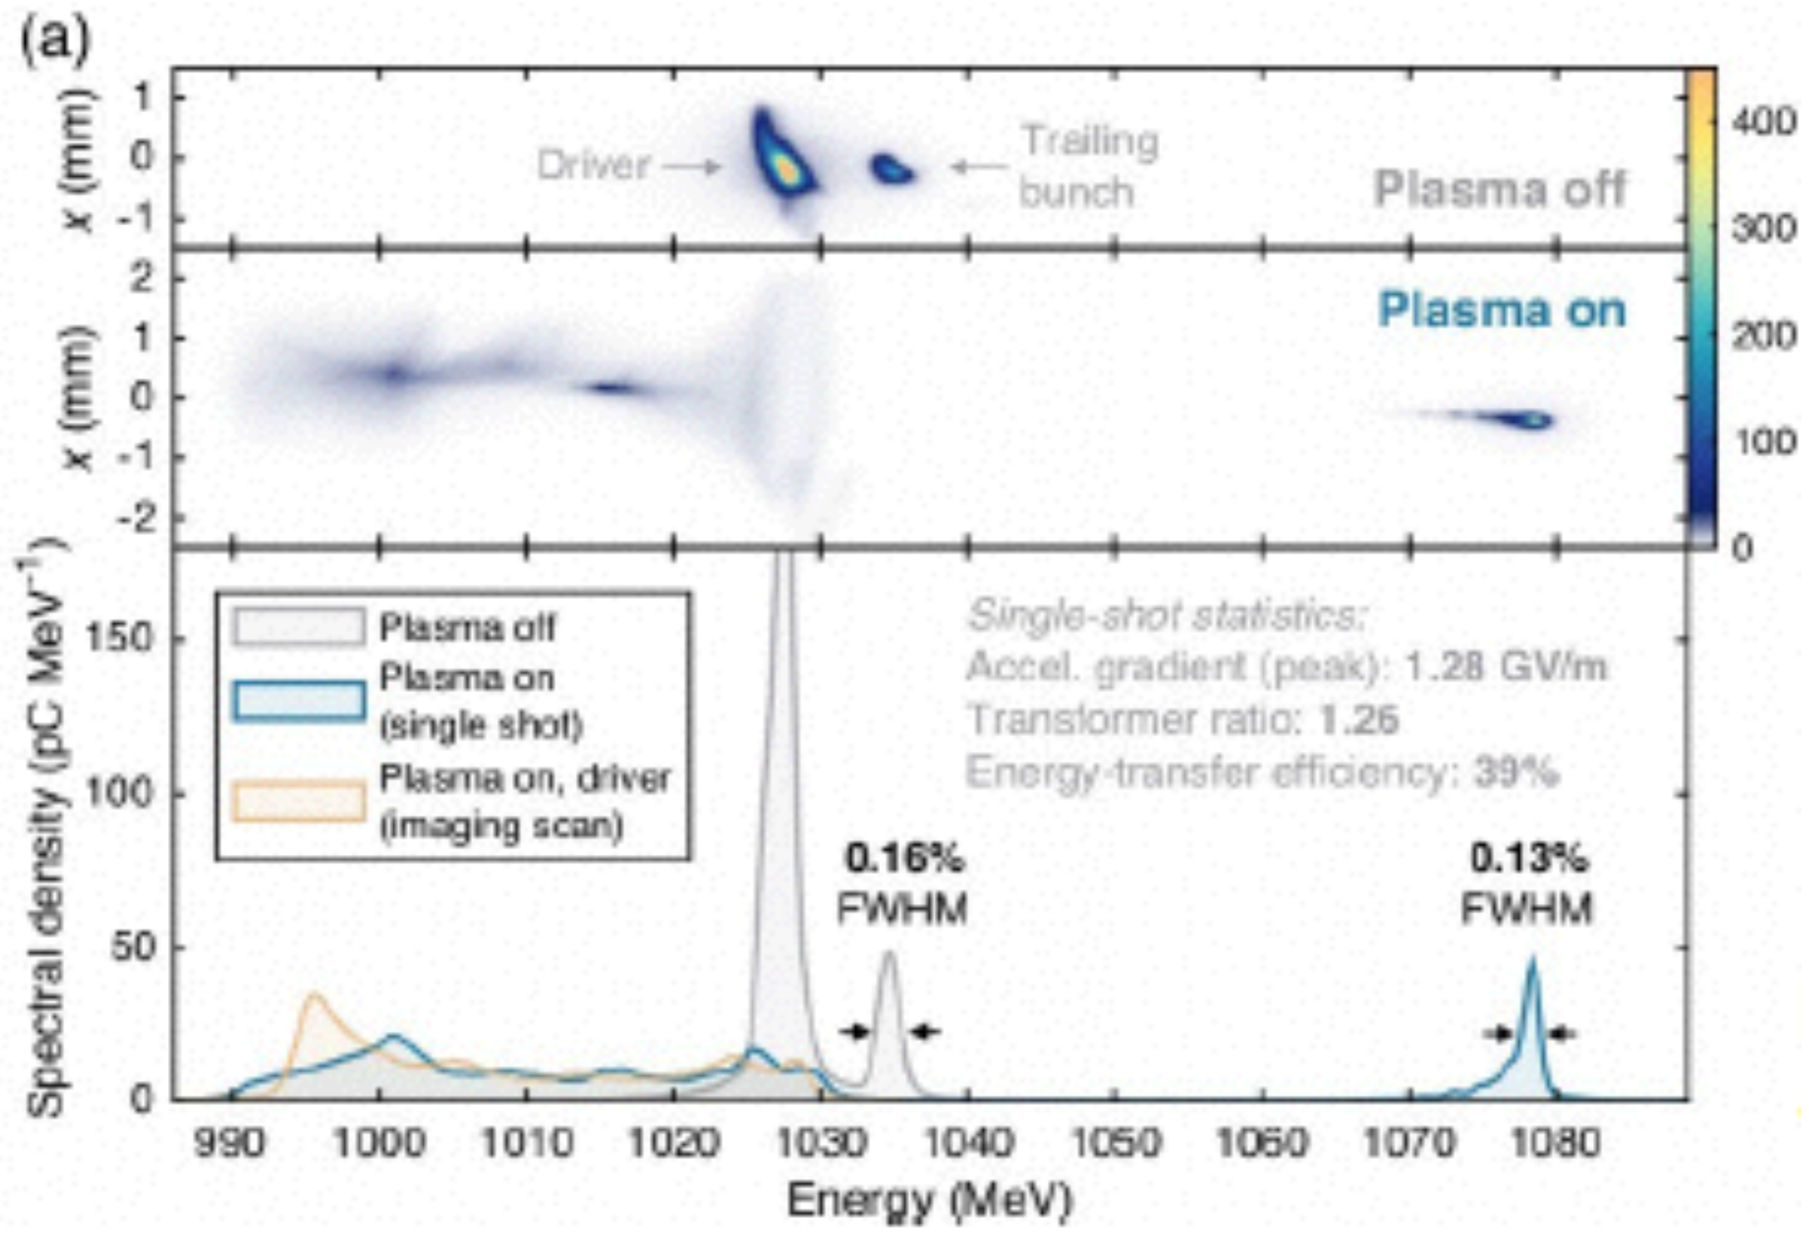
Outline

- Motivation
- Methods and Acceleration Mechanism
    - Laser-based plasma accelerators and beam-based plasma wakefield
- International Scenario
    - Breakthrough results
- Towards a Plasma-based FEL User Facility

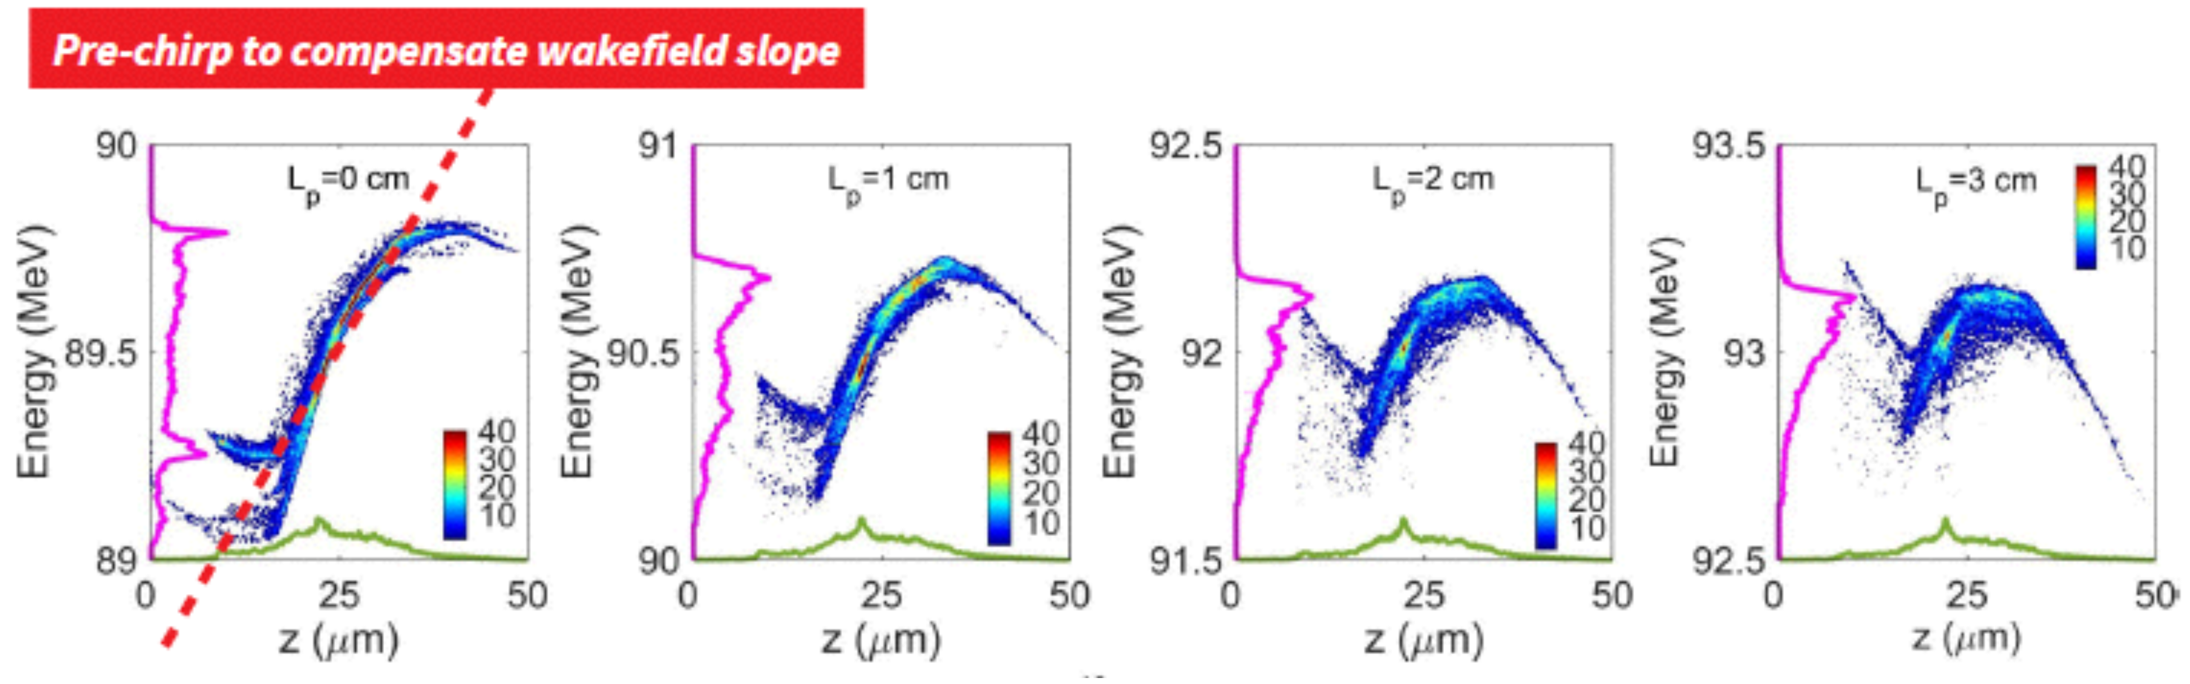
Motivation

- **Plasma-based accelerators** hold **great potential to drive** new generation of compact Free-Electron Lasers (**FELs**) based facilities
- Several advances toward **high quality plasma-accelerated beams**
  - In particular, energy spread optimization

C. A. Lindstroem et al., *Energy-spread preservation and high efficiency in a plasma-wakefield accelerator*, PRL **126,** 014801 (2021)



FLASHForward (DESY)



SPARC_LAB (INFN)

R. Pompili et al., *Energy spread minimization in a beam-driven plasma wakefield accelerator,* Nature Physics, **17** (4), pp. 499-503 (2021)

Methods

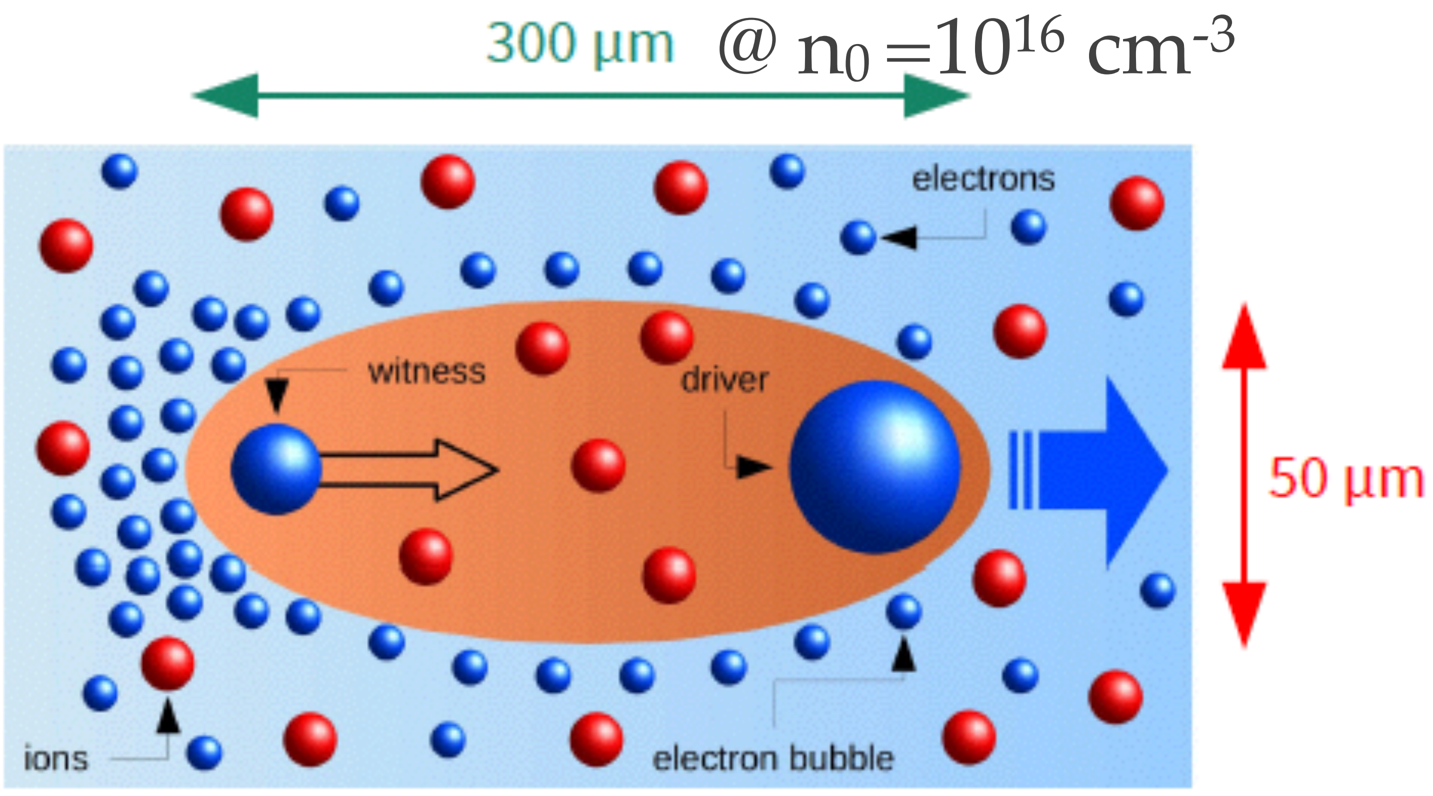
- The **ionized plasma** in a gas-filled discharge capillary, a gas cell or a gas jet **can sustain** accelerating gradient 2-3 orders of magnitude larger than in conventional RF-based accelerators
  - Maximum accelerating field a plasma can sustain: **Wave breaking field**

$$E_{Max}[V/m] = \frac{m_e c \omega_p}{e} \approx 100\sqrt{n_0[cm^{-3}]}$$

$$n_0 = 10^{16} \div 10^{18} cm^{-3}$$

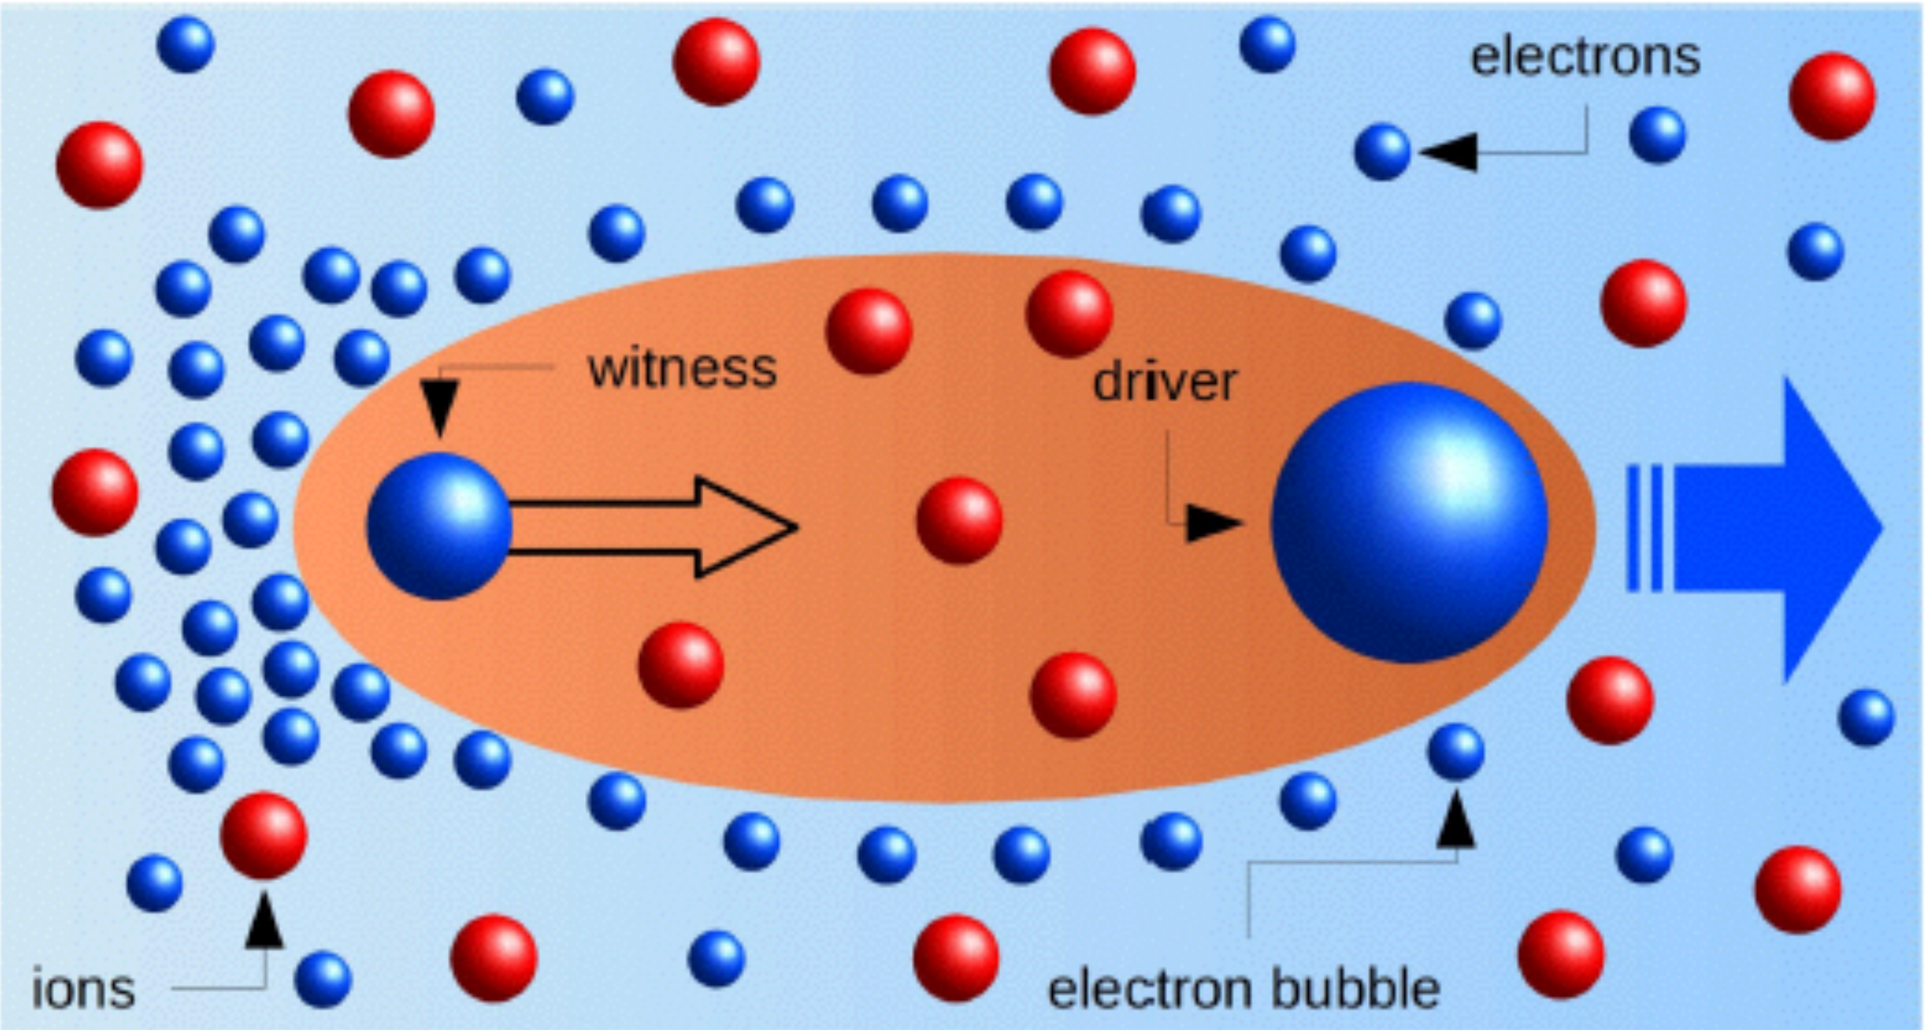
- Characteristic scale length of the accelerating field, i.e. the plasma wake, is the plasma wavelength, $\boldsymbol{\lambda_p}$

$$\lambda_p[\mu m] \approx \frac{3.3 \cdot 10^{10}}{\sqrt{n_0[cm^{-3}]}}$$



enrica.chiadroni@uniroma1.it

Acceleration Mechanism



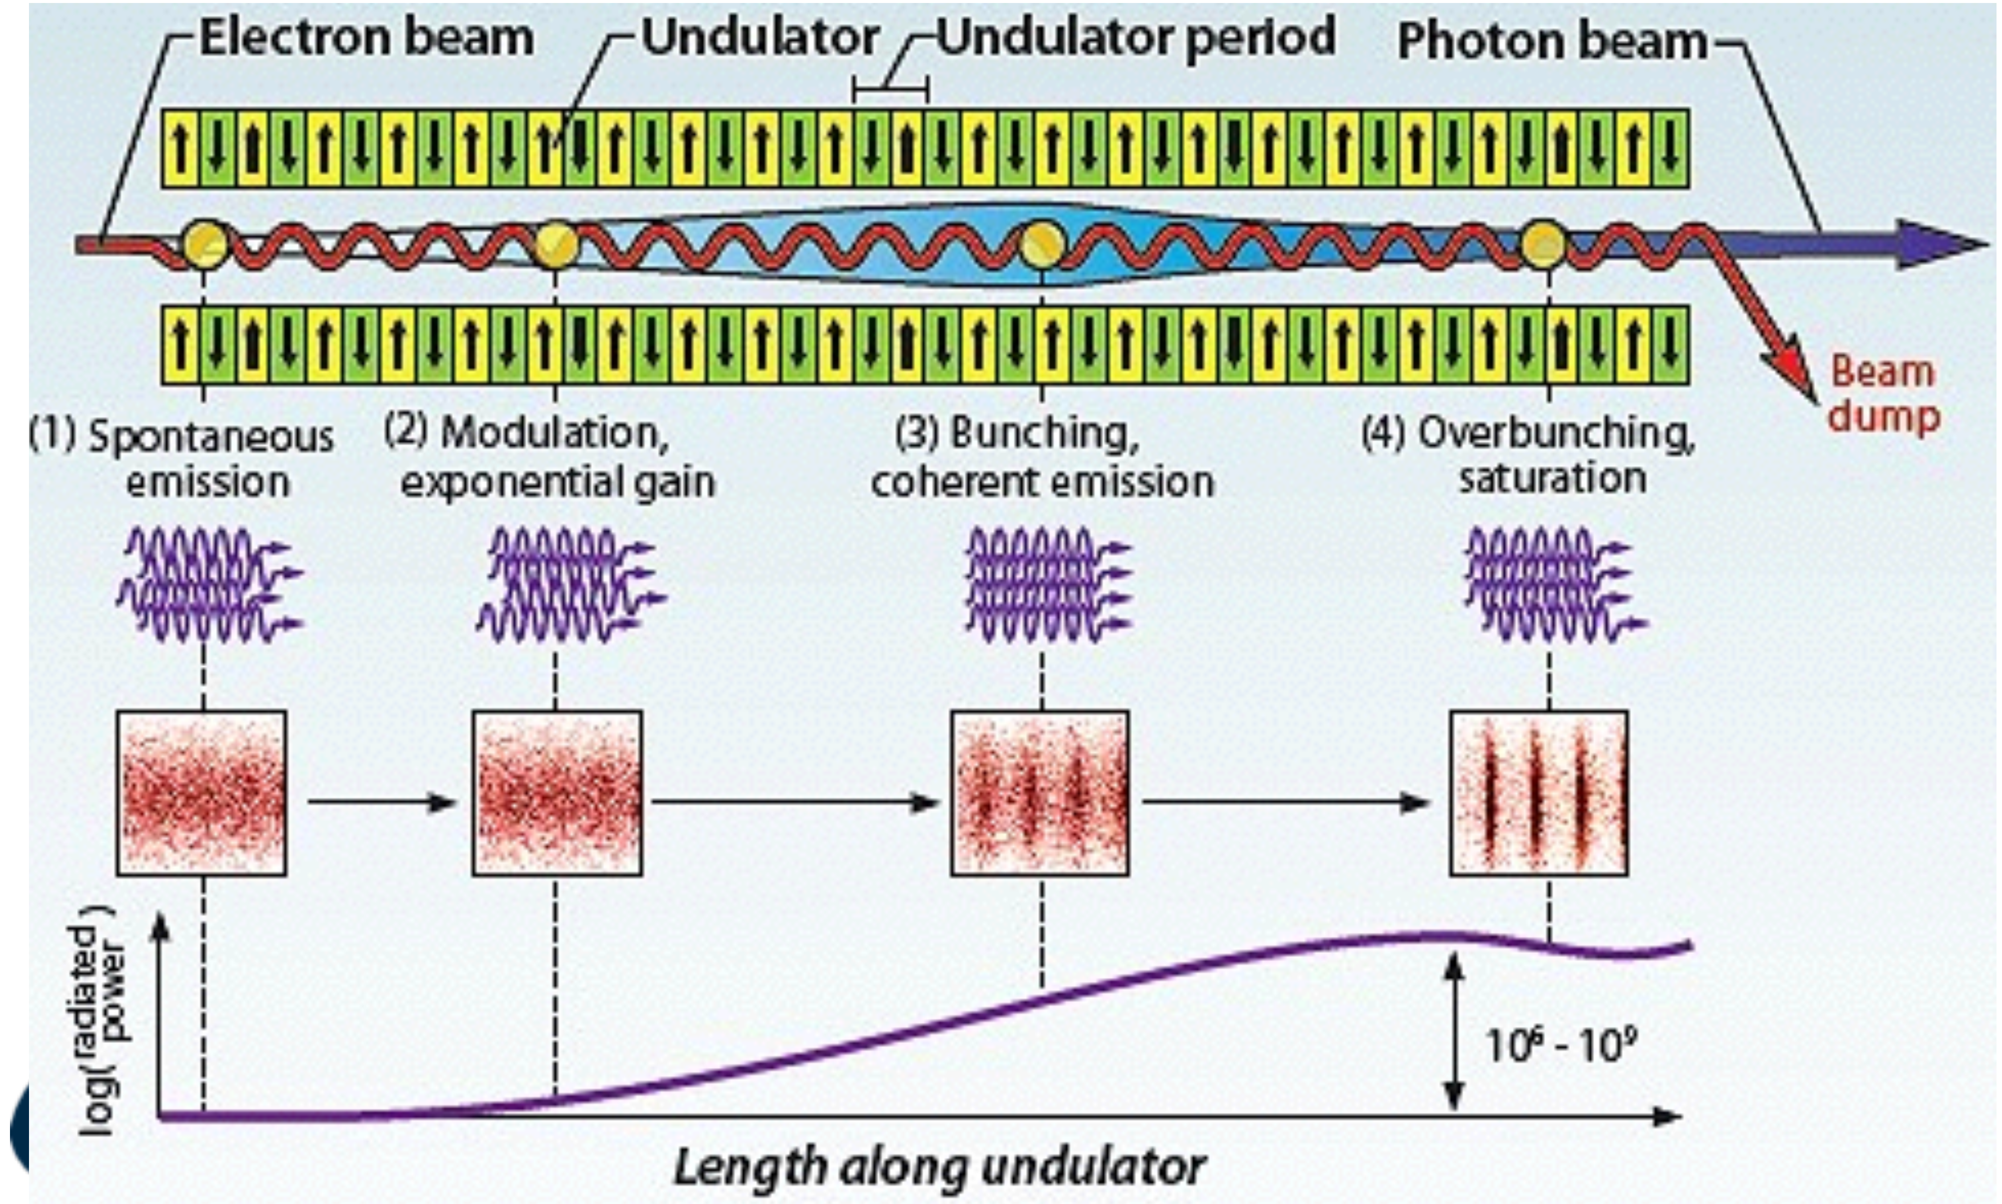
- The **driver**, creating the bubble, can be either a
  - **dense relativistic particle beam** (**PWFA**) of sub-ps duration and kA level peak current
  - **ultra-intense laser pulse** (**LWFA**), ~10^{18} W/cm^2, of few 10s fs duration
- The **witness** can be either **self-injected** or **externally injected**

- Rapid acceleration of injected electrons to ultra-relativistic energies, inside the micrometer-sized structured plasma environment
  - the trapped electron beam remains short, dense, and free of significant space-charge driven emittance degradation

enrica.chiadroni@uniroma1.it

Towards a Plasma-based FEL Facility

- **High quality beam** $\varepsilon_n \ll 1mm\ mrad, I_{peak} \sim kA, \frac{\Delta\gamma}{\gamma} \ll 1\%$
  - 1D model of FEL interaction => Pierce Parameter $\rho = \frac{1}{2\gamma}\left[\frac{I}{I_A}\left(\frac{\lambda_u K[JJ]}{\sqrt{8\pi}\sigma_x}\right)^2\right]^{1/3}$
  - 1D gain length $L_g = \frac{\lambda_u}{4\sqrt{3}\pi\rho}$ => Saturation Power $P = P_{in}e^{\frac{z}{L_g}}$



https://www.lanl.gov/science/1663/june2010/story4b.shtml

- **Long term and shot-to-shot stability and reproducibility**
- **High repetition rate: from 10s Hz to 100s Hz and ~kHz**
  - Preferable for maximizing average power

International Scenario for LWFA

	COXINEL	DESY-LUX	SIOM	LBNL-BELLA
Charge density [pC/MeV]	0.5	4	1–5	2
Repetition rate [Hz]	1–10	1	1–5	5
Mean energy [GeV]	0.18–0.4	0.3	0.84	0.1–0.3
Slice energy spread RMS [%]	NA	0.5	0.24–0.4	0.2–1
Charge [pC]	NA	50	8–25	25
Emittance [mm-mrad]	1	1.5 (horz.), 0.3 (vert.)	0.4	0.3–1
FEL wavelength [nm]	UV-VUV	100	6–10	80
Undulator technology	Cryo-PMU	Cryo-PMU	Planar and TGU	Planar + strong focusing
FEL operation modes	Decompression + seeding	Decompression + SASE	SASE, transverse decompression	Decompression + seeding
Key challenge pursued	Demonstrate FEL gain	Demonstrate FEL gain	Demonstrate FEL gain	Demonstrate FEL gain

FEL, free-electron laser; PMU, permanent magnet undulator; RMS, root mean square; SASE, self-amplification of spontaneous radiation; TGU, transverse gradient undulator.

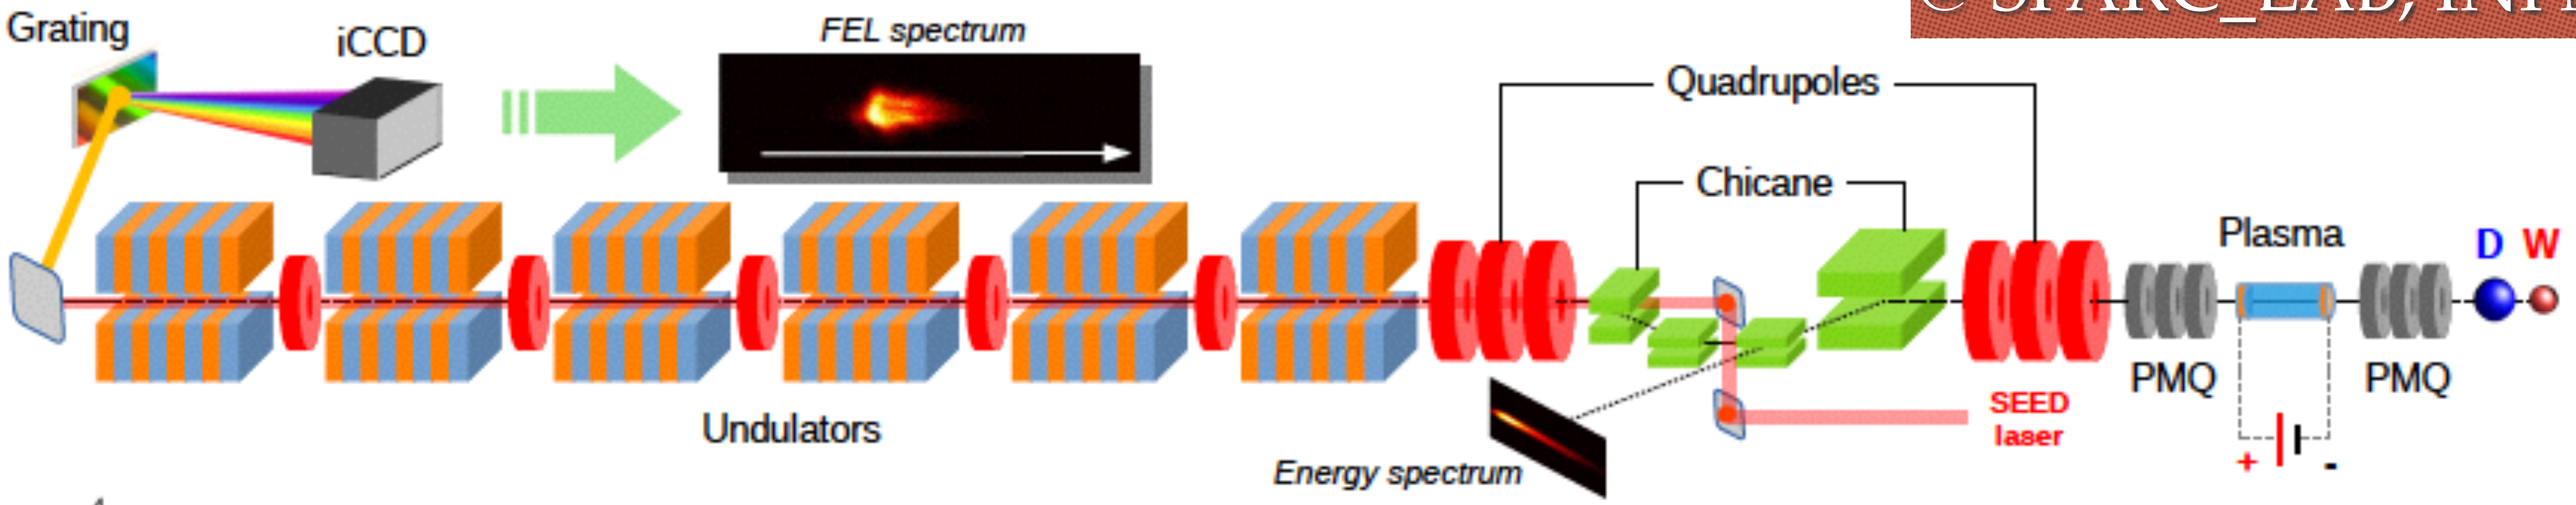
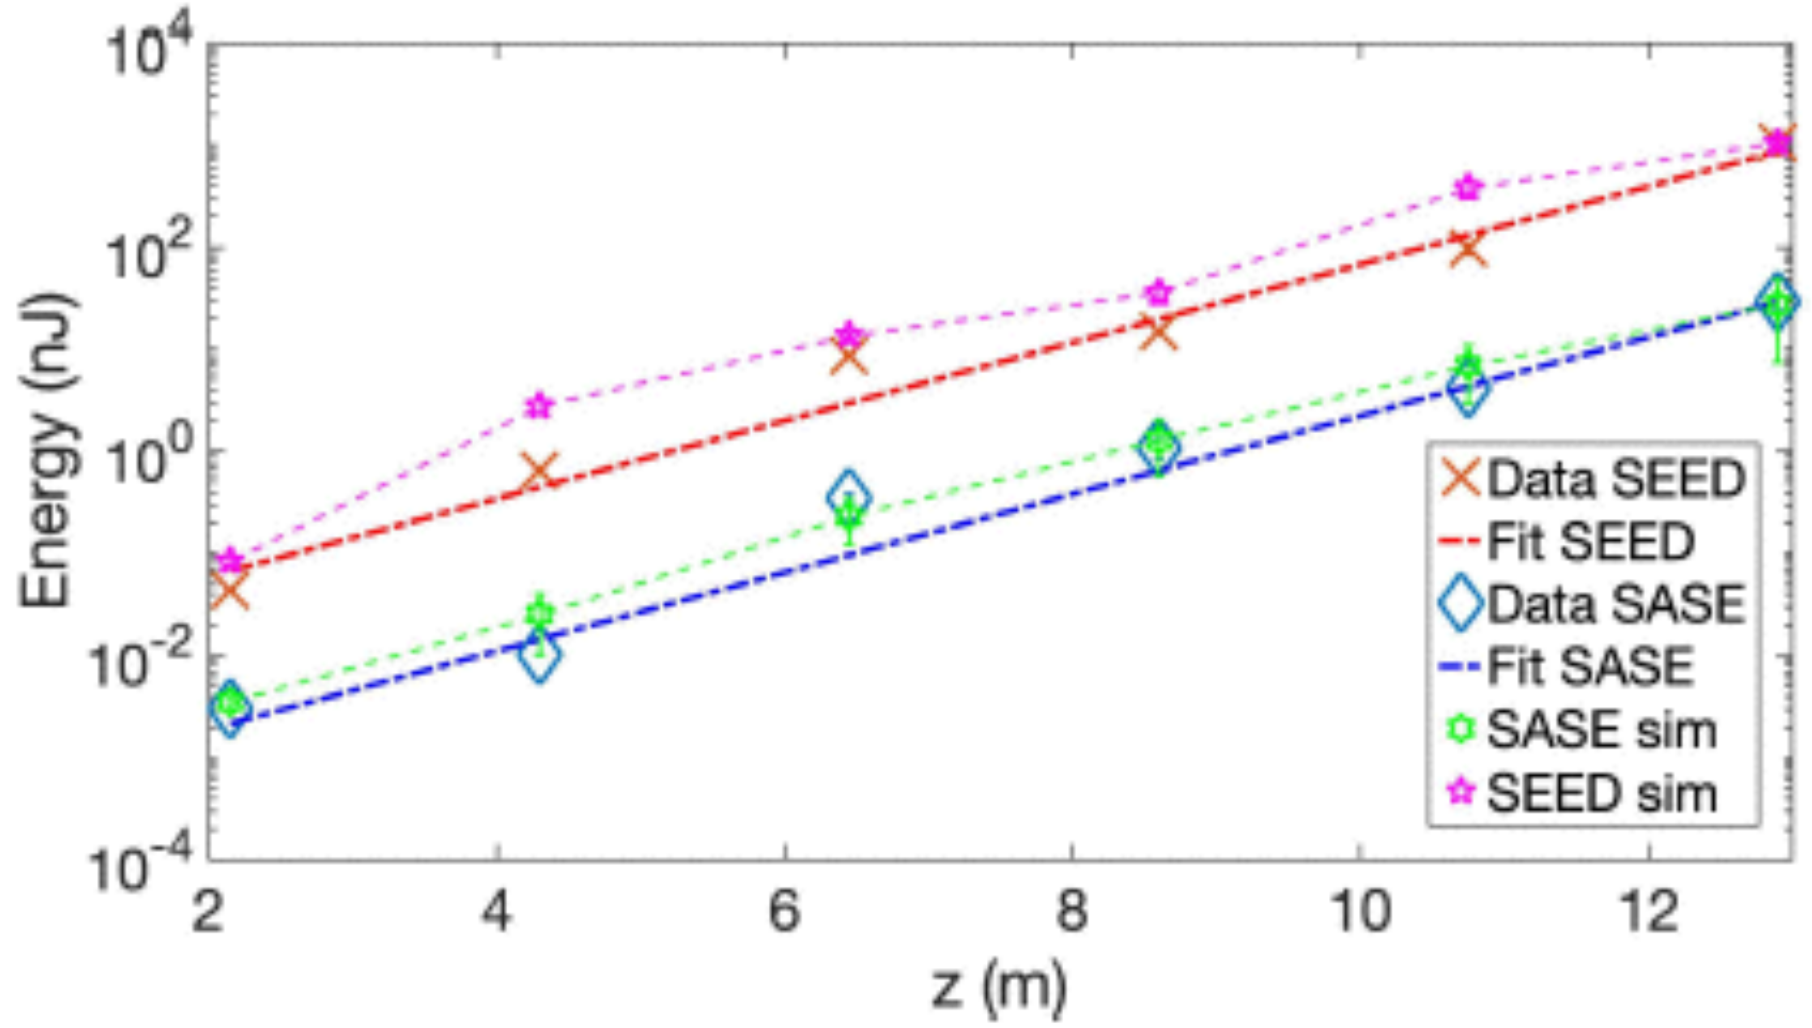
First PWFA-driven Seeded FEL

@ SPARC_LAB, INFN Frascati





Seeded FEL Radiation

- Part of the EOS laser used as seed
- Seed laser ~ 795 nm, FEL peak 827 nm
- Pulse energy increase from 30 nJ up to 1 μm
- Increased stability of emitted radiation

M. Galletti et al., submitted to NaturePhotonics

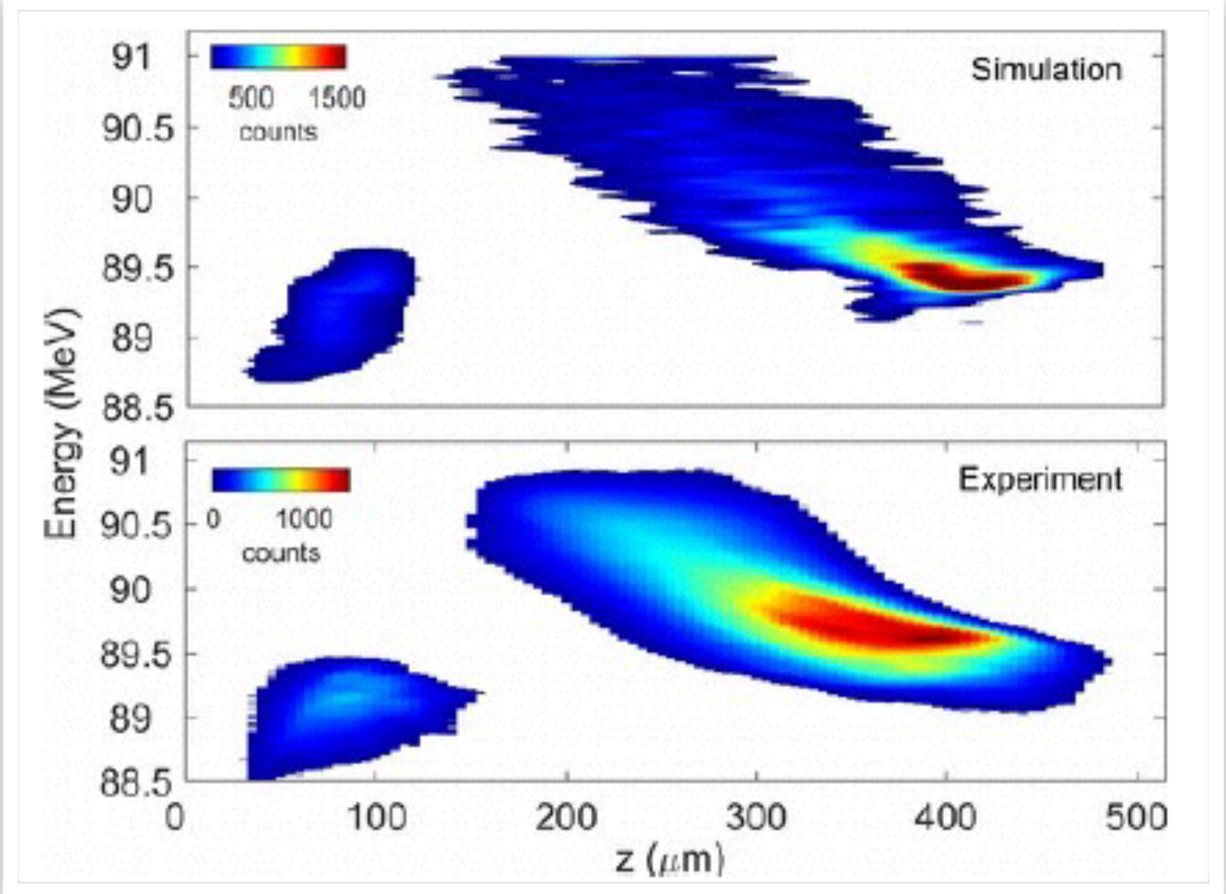
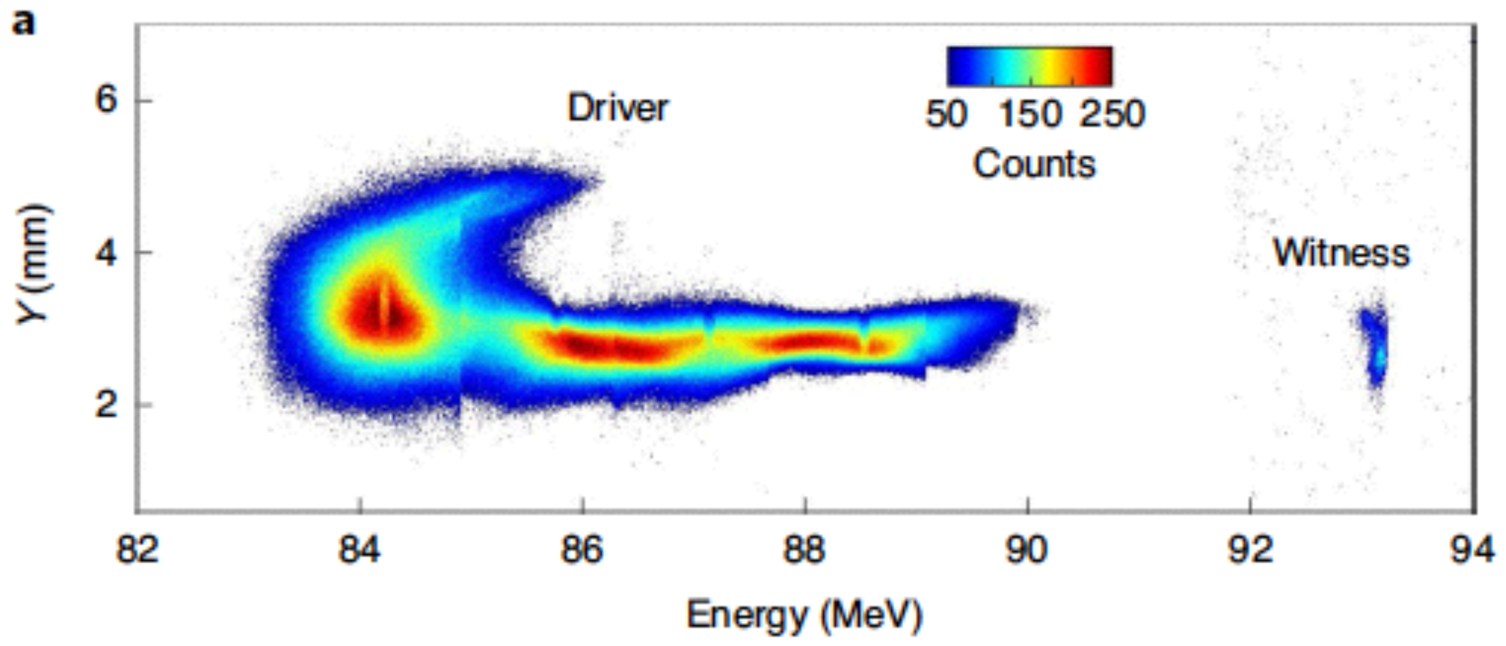
Two-Bunches in the Driver-Witness Configuration

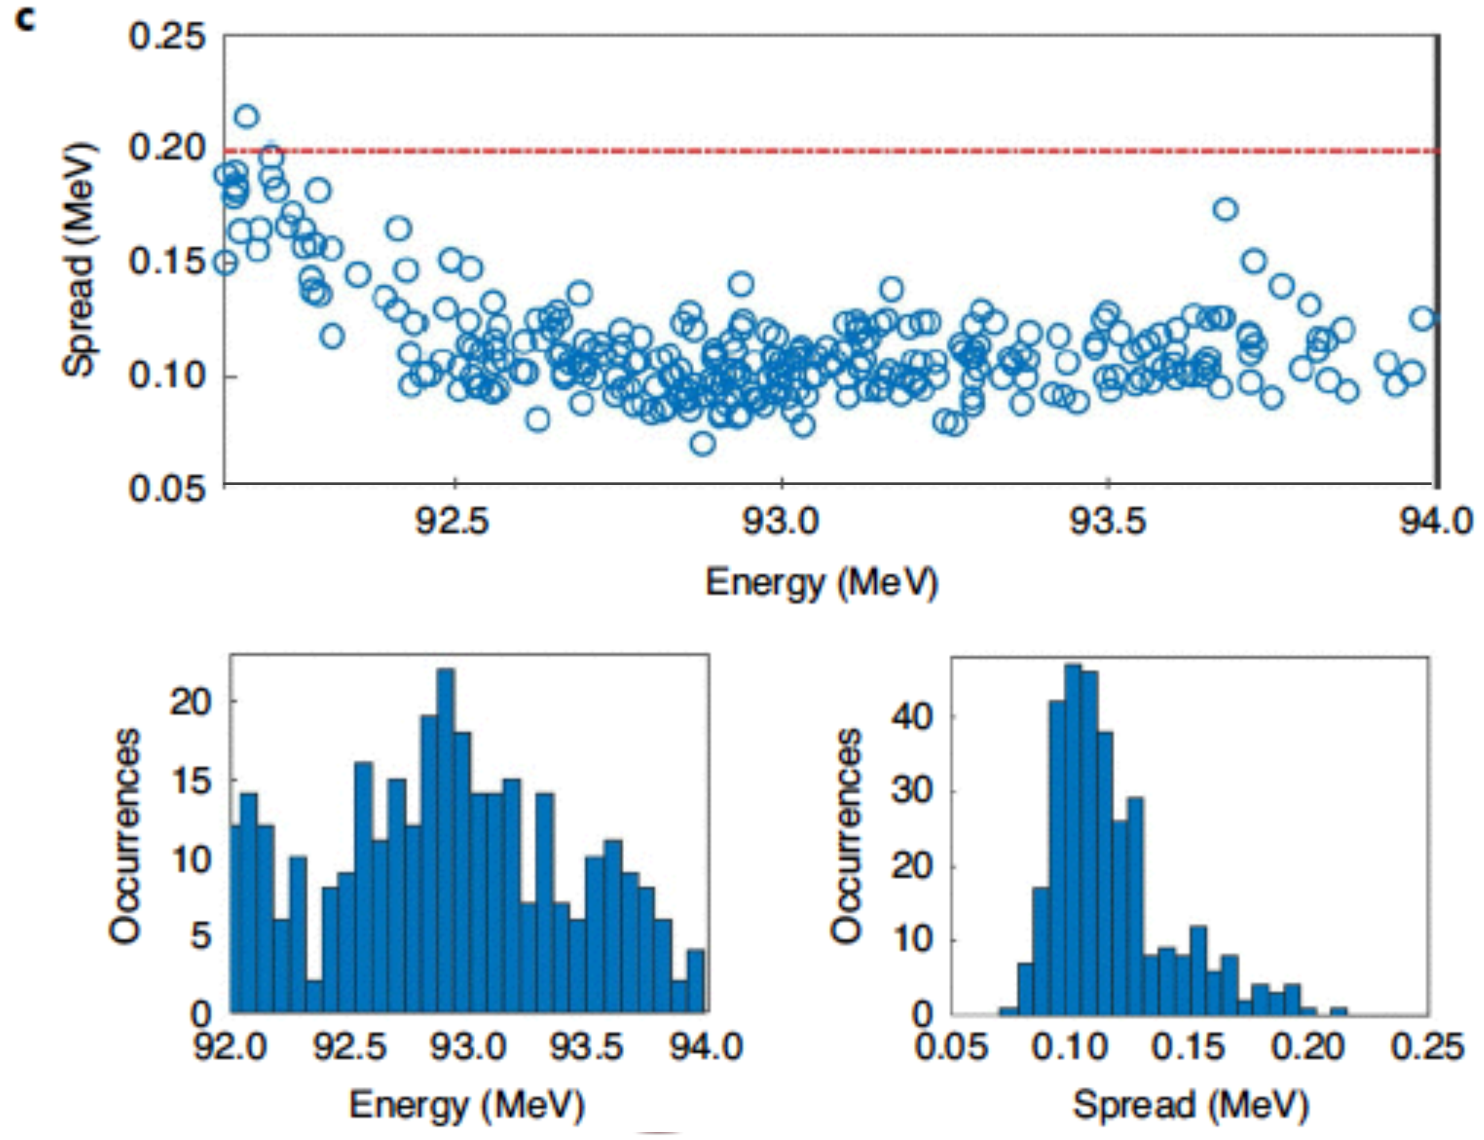
- Two-bunches configuration produced directly at the cathode with laser-comb technique
  - 200 pC driver followed by witness bunch (20 pC)
- Ultra-short durations (200 fs + 30 fs)
- Separation approximately equal to half plasma wavelength (~1.2 ps)



- **Energy spread reduction in the beam driven PWFA experiment**

- 4 MeV acceleration in 3 cm plasma with 200 pC driver
  - ~133 MV/m accelerating gradient
  - 2x10^{15} cm^{-3} plasma density
  - Energy spread from 0.2% to 0.12%



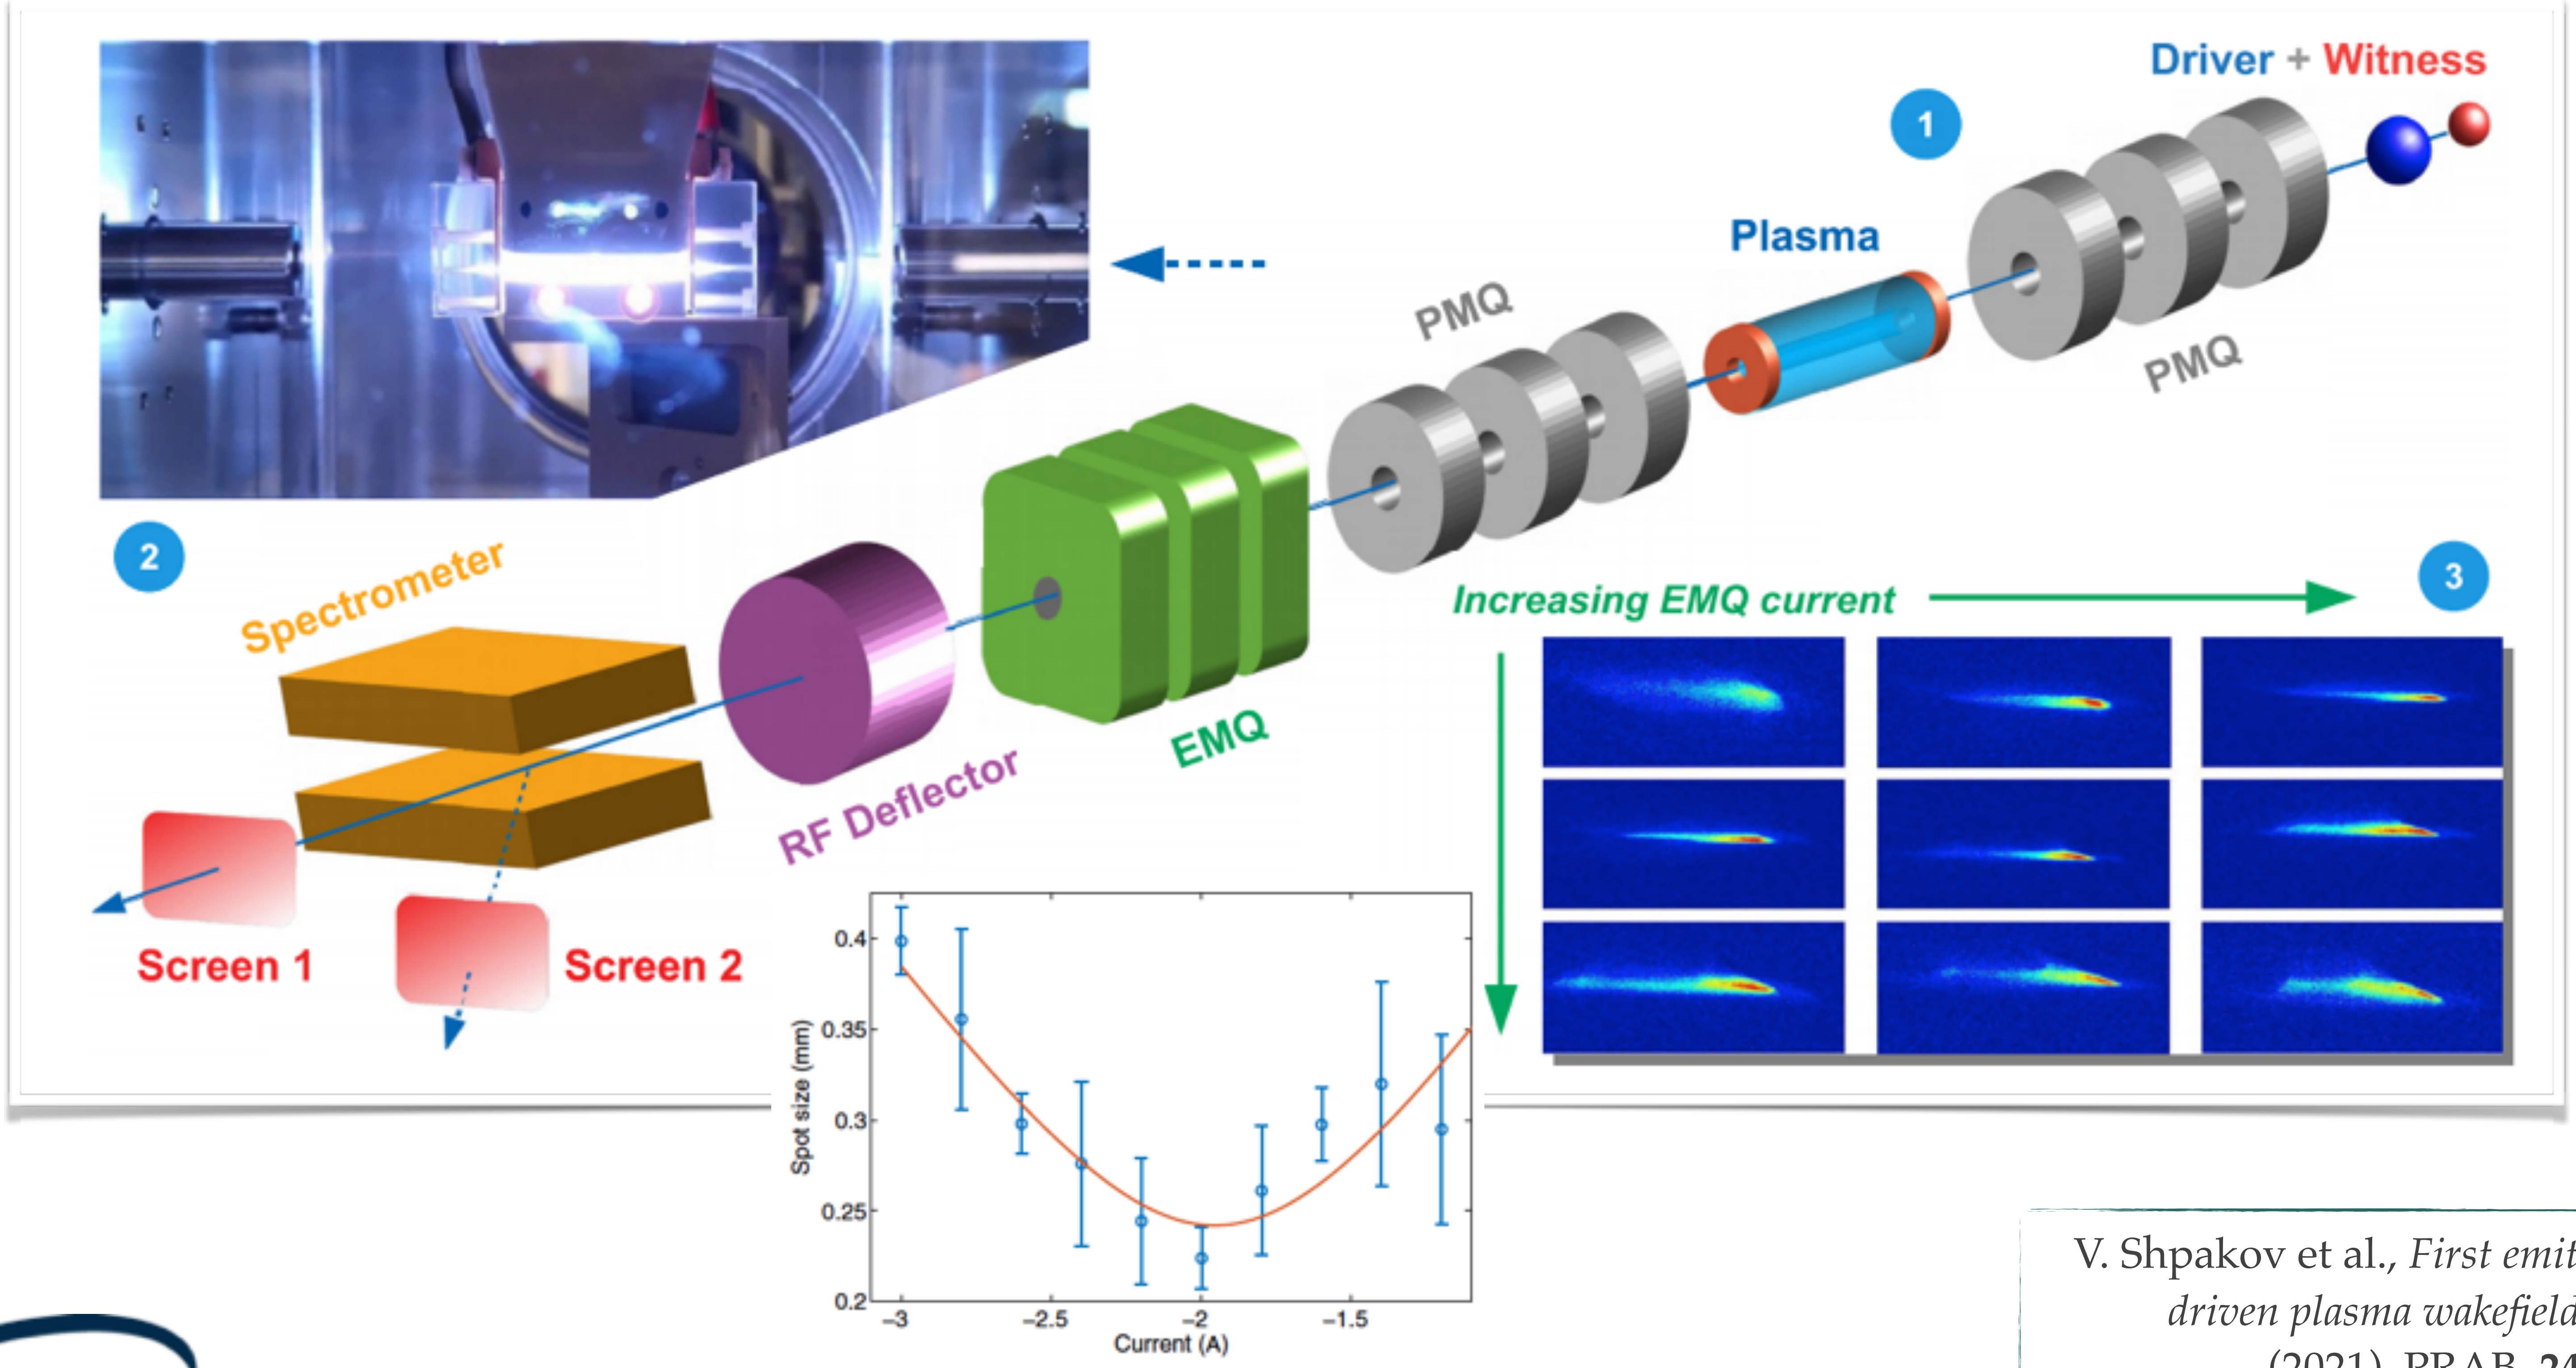


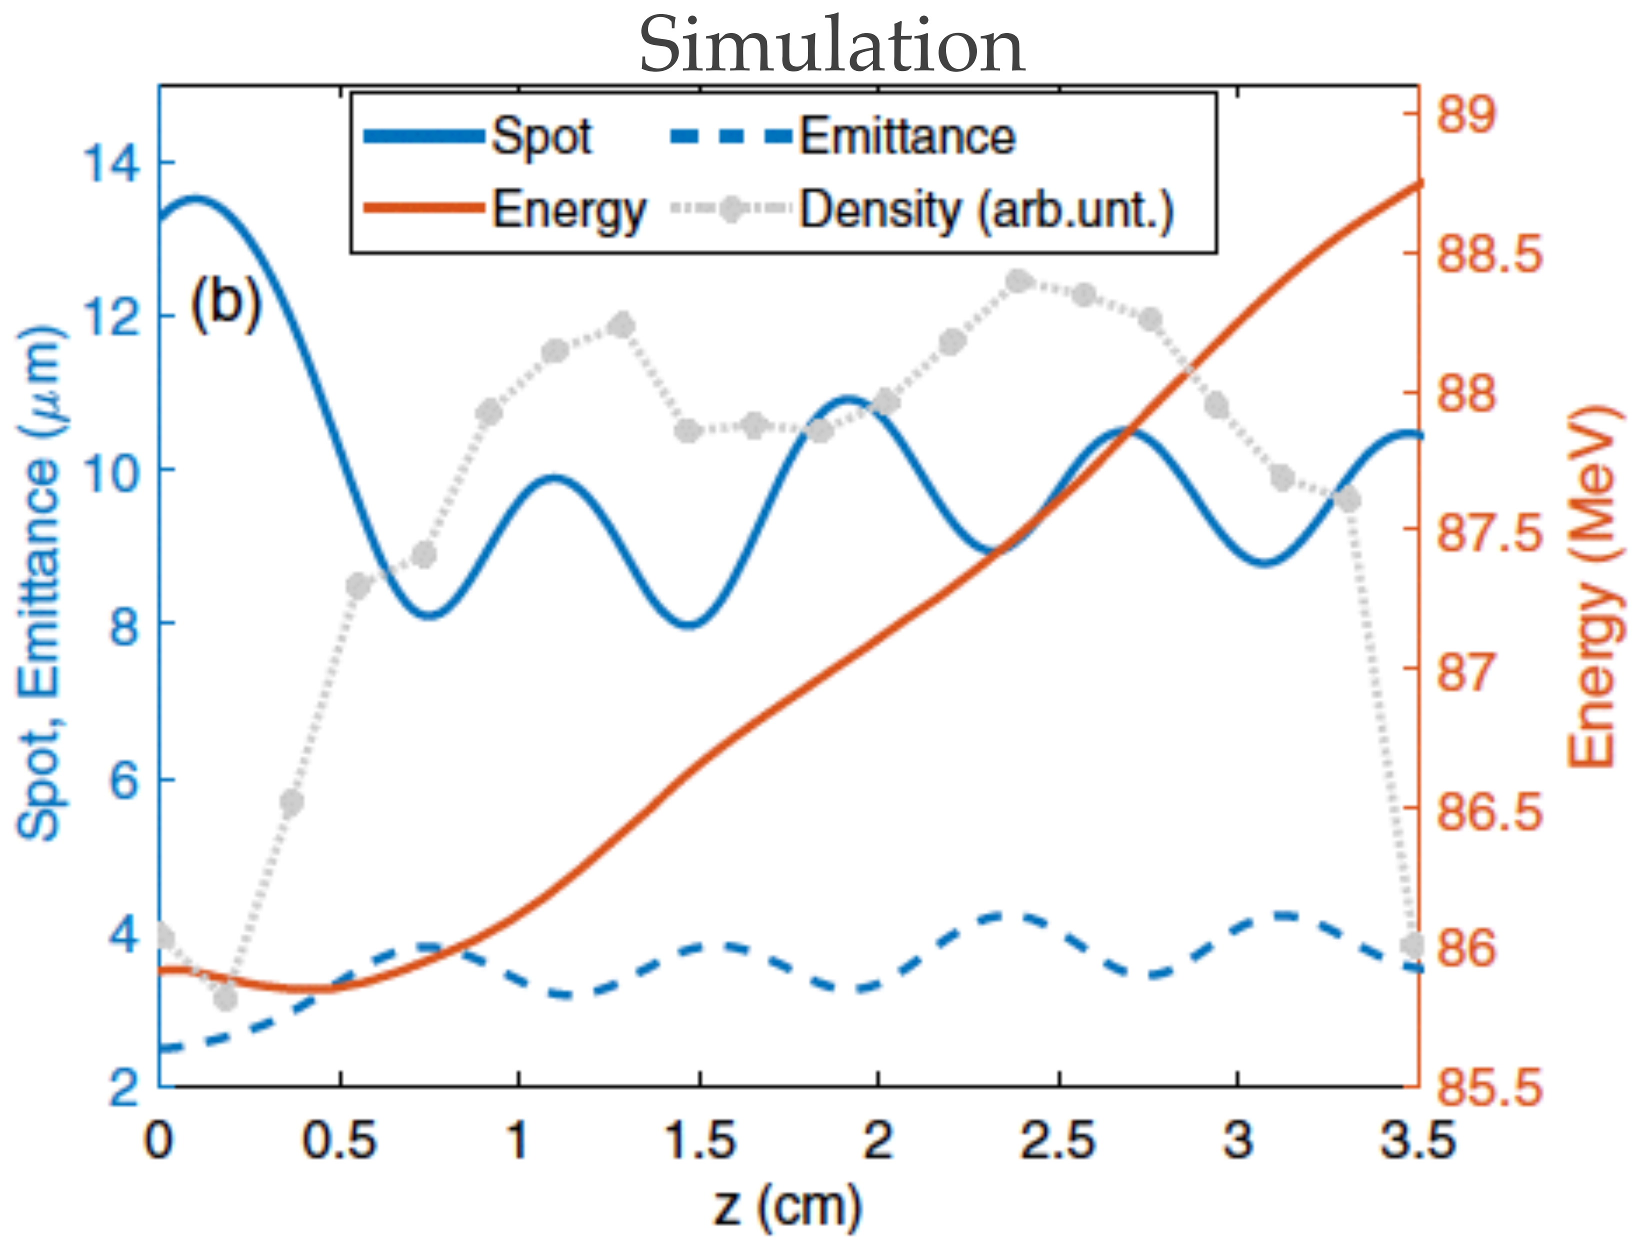
R. Pompili et al., *Energy spread minimization in a beam-driven plasma wakefield accelerator* (2021), Nature Physics, **17** (4), pp. 499-503

enrica.chiadroni@uniroma1.it

First normalized emittance measurement

- **First PWFA transverse normalized emittance characterization**
  - Multi-shot quadrupole scan technique to measure the plasma-accelerated witness normalized emittance
    - emittance increase from 2.7 um to 3.7 um (rms) during acceleration because of non optimized matching





V. Shpakov et al., *First emittance measurement of the beam-driven plasma wakefield accelerated electron beam*, (2021), PRAB, **24** (5), art. no. 051301

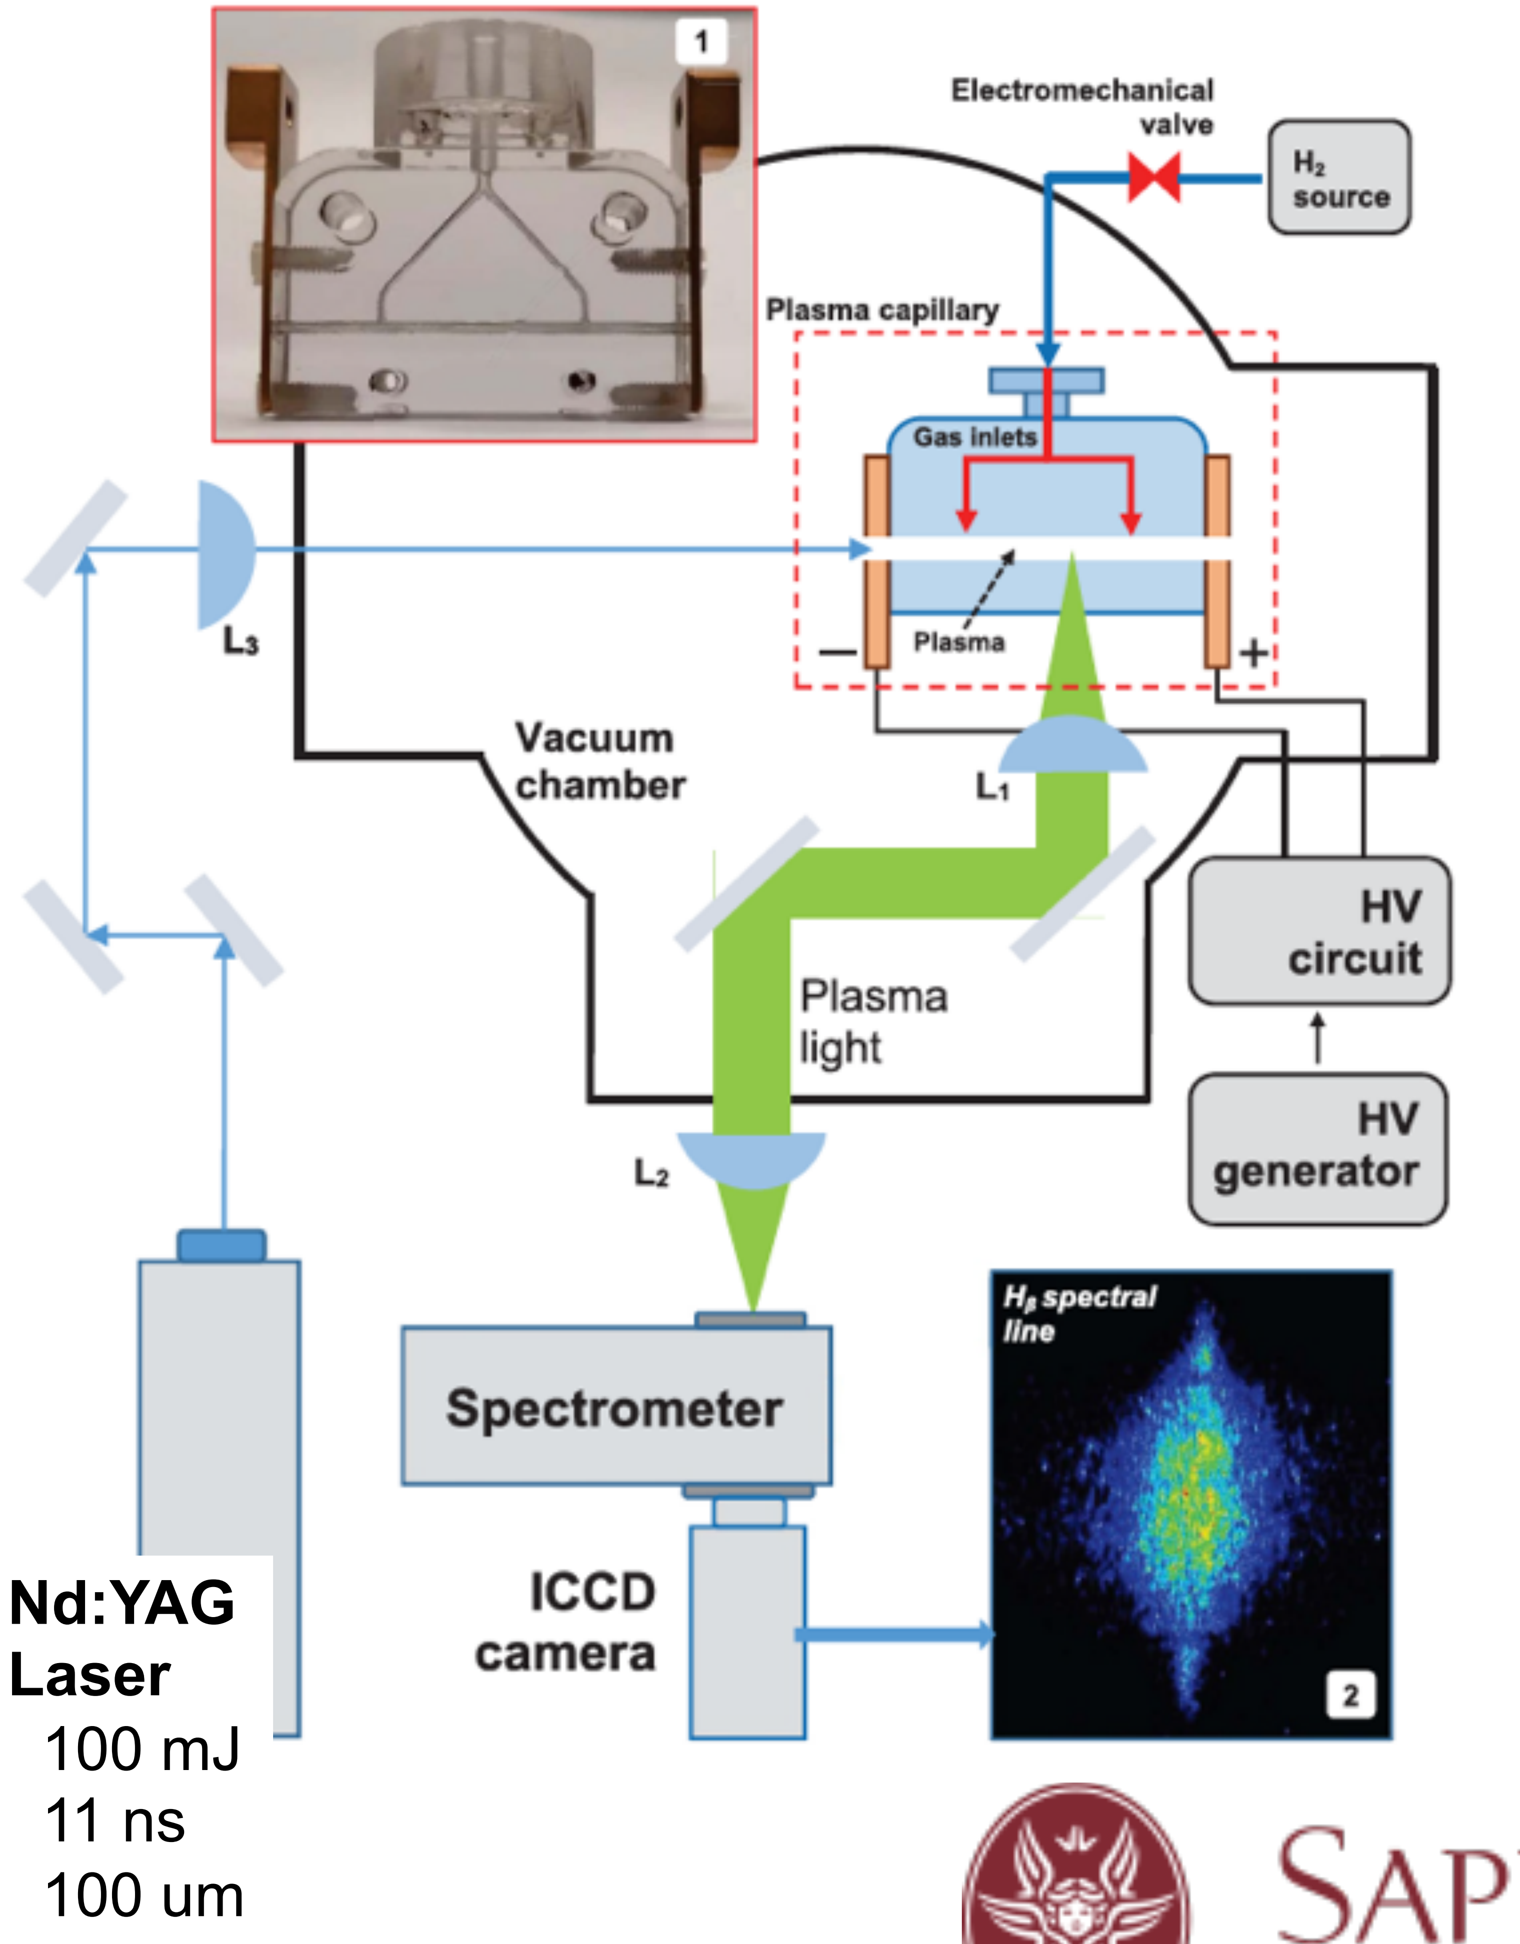
Gas-filled Capillary-Discharge Stabilization

Courtesy of A. Biagioni (INFN-LNF)

- **Discharge ignition depends on the operating conditions**, since the breakdown voltage depends on the molecules distribution inside the capillary (pressure and length)
- Discharge timing jitter is affected by the **voltage** and the **gas pressure** in the capillary
- To **decrease the time jitter** (and so the shot-to-shot instability) **a laser pulse** can be used **to ignite the discharge**

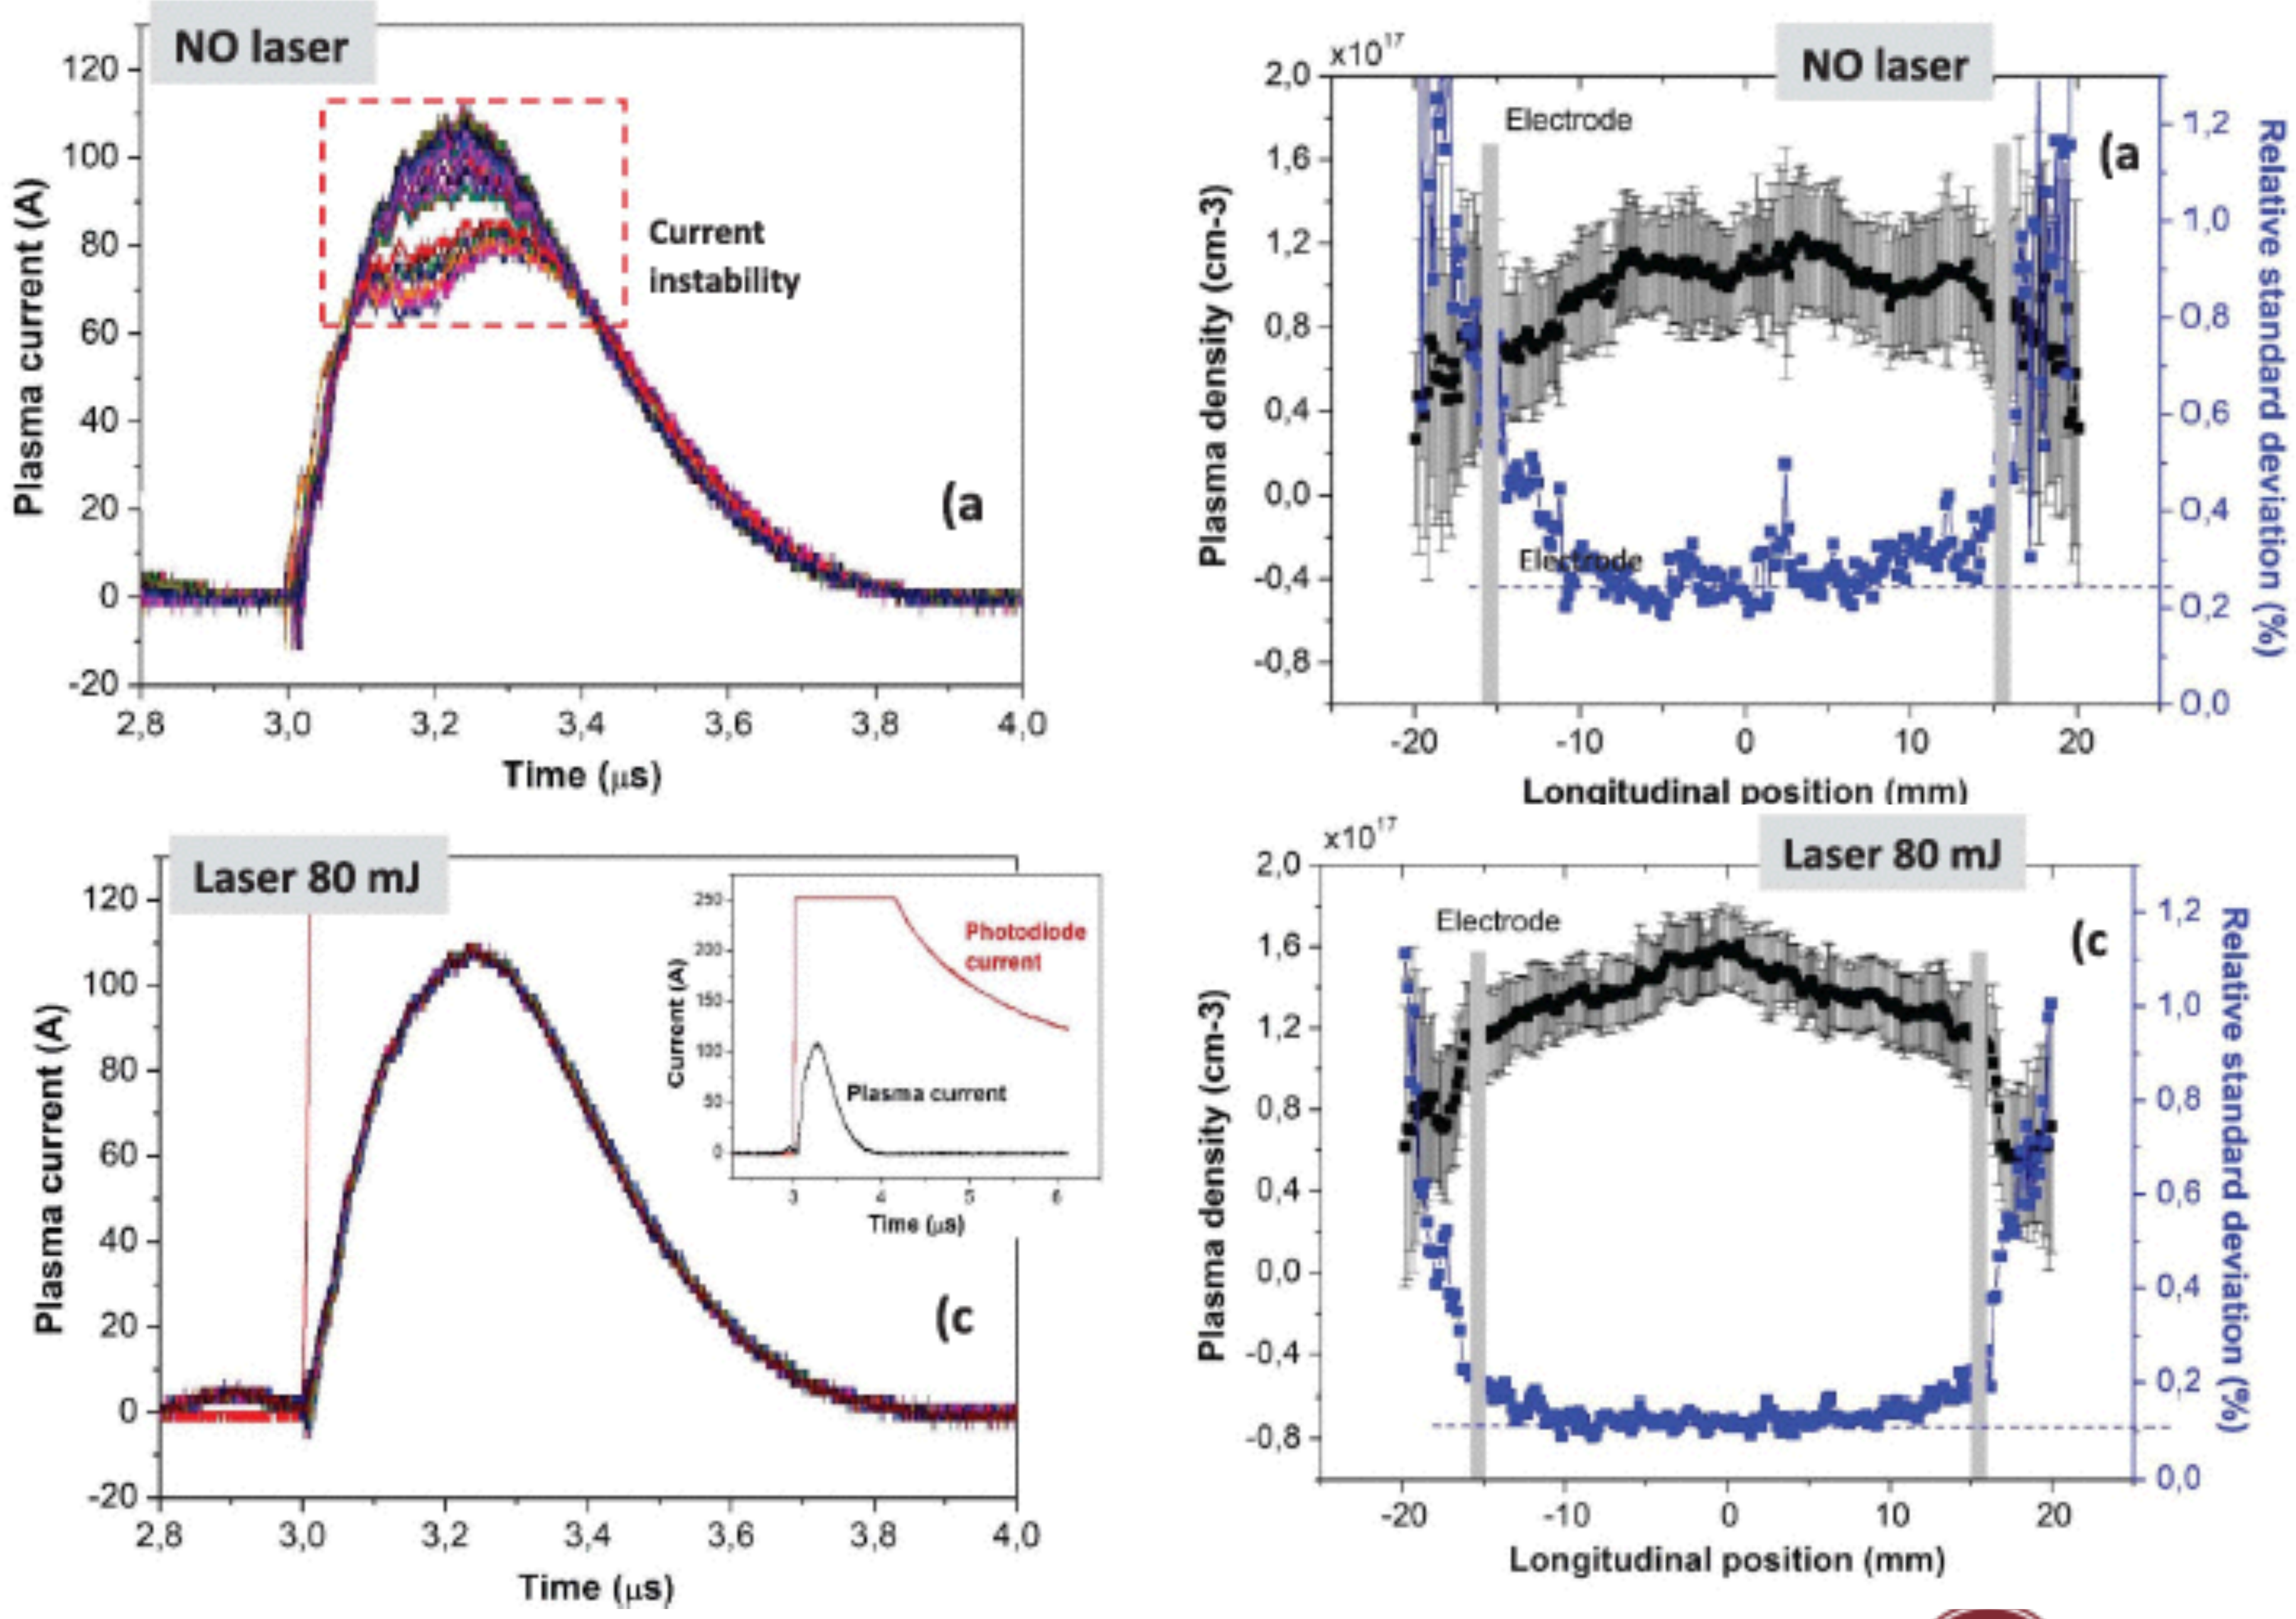


enrica.chiadroni@uniroma1.it

Gas-filled Capillary-Discharge Stabilization

Courtesy of A. Biagioni (INFN-LNF)

- Plasma density instability reduced **from 25% to 11%** at 5kV
- Instability of **5%** when operating **at 8 kV** (evaluated from Stark measurement)



The first 40 cm Long Gas-filled Capillary Discharge

Recent result in the Plasma Lab at SPARC_LAB: First EuPRAXIA plasma source enabling 1.1 GeV (1.5 GV/m)

Courtesy of A. Biagioni (INFN-LNF)

Image captured during the formation of plasma in the **capillary 40 cm long** and **2 mm** in **diameter**.

The **applied voltage** pulse is **9 kV** and the **peak current** reaches about **500 A**.

Conclusions

- **Impressive progress** has been done **toward the operation of a FEL user facility**
  - **Recent demonstration of SASE FEL driven by both PWFA** (SPARC_LAB, INFN -Frascati) **and LWFA** (SIOM, Shangai)
    - Success driven by the **ability of the community to overcome** several **key challenges** facing plasma-FEL operation
      - **stabilization** and **control** of the acceleration process, which turns into **energy spread mitigation**, normalized **emittance preservation**, overall stability gain
- However, **improvements** are **still needed** in terms of
  - electron beam quality
    - **sub-percent to sub-per-mille energy spread** and **mm mrad to sub-mm mrad emittances**
  - **increase** of the **repetition rate** from a few hertz to kilohertz
  - **improvement of shot-to-shot stability**
- An entire community is working hard to achieve this result and the selection of **EuPRAXIA**, as **first ever plasma accelerator project**, **in the ESFRI Roadmap** is the validation of the quality and readiness of the work done and the technology
    - **The realization of a plasma-based user facility seems more and more a reality!**
